

# BUSINESS PLAN

Berlin Liaison Office (Verbindungsbüro)

**Genomer Biotechnology R&D Industry and Trade Ltd. Co.**

Türkiye

Document Reference: GEN-DE-BP-2026/073

Date: 22.04.2026

Version: 1.0

## 1. Executive Summary

Genomer Biotechnology is a Türkiye-based *in vitro* diagnostic (IVD) company that develops and manufactures real-time PCR (qPCR) kits in its ISO 13485-certified production facility. The company is currently undergoing IVDR 2017/746 conformity assessment for a defined portfolio of Class B and Class C kits, with a Notified Body engagement already initiated.

In preparation for entry into the European Union market, Genomer will establish a **liaison office (Verbindungsbüro)** in **Berlin, Germany**. The liaison office will not engage in commercial activity. Its objectives are limited to scientific relationship building with Key Opinion Leaders (KOLs), market intelligence gathering, promotional groundwork and on-the-ground coordination of the IVDR certification process. Once IVDR certification is in place, the liaison office will be converted into a **GmbH** with full commercial capacity (Phase 2).

### PHASE 1 — NOW

Liaison office in Berlin. Promotion, KOL engagement, market research, IVDR coordination. No revenue.

### PHASE 2 — ~12 MONTHS

Conversion to GmbH following IVDR certification. Full commercial activity in Germany and EU.

### FUNDING

100% funded from the parent company's own resources. No external financing required for Phase 1.

### PERSONNEL

Phase 1 operated remotely by Türkiye-based management. No local hire planned during Phase 1.

## 2. Company Profile

Genomer Biotechnology R&D Industry and Trade Ltd. Co. (hereinafter "Genomer") is a privately held Turkish company that designs, develops and manufactures molecular diagnostic kits based on real-time PCR technology. The company operates from its production facility in Gebze, Kocaeli, within an established biotechnology cluster supported by Türkiye's national R&D infrastructure.

|                          |                                                                                                                       |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Legal Name</b>        | Genomer Biotechnology R&D Industry and Trade Ltd. Co.                                                                 |
| <b>Country</b>           | Republic of Türkiye                                                                                                   |
| <b>Headquarters</b>      | Bariş SB Mah. 5003 Sk. Kadir Has Building, Section A No: 2 / Z14, Gebze / Kocaeli                                     |
| <b>Quality System</b>    | ISO 13485 certified medical device quality management system                                                          |
| <b>Regulatory Status</b> | IVDR 2017/746 conformity assessment in progress with a designated Notified Body                                       |
| <b>Core Activity</b>     | R&D, manufacturing and commercialisation of qPCR-based IVD kits                                                       |
| <b>Domestic Market</b>   | Established commercial presence across private laboratory chains, university hospitals and state hospitals in Türkiye |

## 2.1 Strengths

- Vertically integrated R&D and production capability — kits are designed, validated and manufactured in-house.
- Mature quality system with ISO 13485 certification and active IVDR transition.
- Proven domestic commercial track record across the Turkish IVD market, including TJOD-active gynecology accounts and major laboratory groups.
- Multilingual scientific and regulatory documentation already produced in English.

## 3. Product Portfolio Targeted for the European Market

The product families listed below are within the scope of the current IVDR 2017/746 conformity assessment. All products are developed and manufactured by Genomer in Türkiye.

| Product Family             | Application Area                                                                 | IVD Class |
|----------------------------|----------------------------------------------------------------------------------|-----------|
| Femobiome qPCR Kit Family  | Female urogenital microbiota assessment (screening, full quantitative profiling) | B / C     |
| Androbiome qPCR Kit Family | Male urogenital microbiota assessment                                            | C         |
| Enterobiome Kids qPCR Kit  | Paediatric intestinal microbiome analysis (children only)                        | C         |
| HPV Screening qPCR Kit     | High-risk HPV screening                                                          | C         |
| HPV 21 Genotyping qPCR Kit | 21-genotype HPV genotyping                                                       | C         |

**Differentiation.** Genomer's kits combine quantitative microbiota profiling with high-risk HPV detection from compatible sample types, enabling laboratories to consolidate women's-health and microbiome workflows on a single qPCR platform — a clinically relevant proposition for German laboratory chains seeking workflow efficiency.

---

## 4. Strategic Rationale — Why Germany, Why Now

---

### 4.1 Germany as the EU Entry Point

Germany is the largest healthcare market in the European Union and one of the most regulated. Achieving credibility in Germany is widely regarded as a prerequisite for sustainable expansion into other EU markets. The country also hosts a dense network of university hospitals, reference laboratories and Key Opinion Leaders in women's health, urology and gastroenterology — the precise clinical disciplines addressed by Genomer's portfolio.

### 4.2 Berlin as the Office Location

Berlin offers immediate proximity to Charité — Universitätsmedizin Berlin, one of Europe's leading academic medical centres, as well as easy access to Munich (Technische Universität München) and Heidelberg (Universität Heidelberg) — the three KOL clusters most relevant to Genomer's portfolio. Berlin also provides a cost-efficient and internationally connected operating base for a small representative office.

### 4.3 Timing — Aligned with IVDR Certification

The IVDR 2017/746 transition has fundamentally reshaped the European IVD landscape, creating a window of opportunity for new entrants who arrive with a fully certified, IVDR-native portfolio. Establishing the liaison office now — during the certification period — enables Genomer to build scientific awareness and customer pipelines in parallel with the regulatory process, so that commercial conversion (Phase 2) can begin as soon as certification is granted.

---

## 5. Phase 1 — Liaison Office Operations

---

### 5.1 Scope

The Berlin liaison office will operate as a non-trading representative office under German law (Verbindungsbüro). It will not place products on the EU market, will not invoice customers and will not generate revenue. Its activities are scientific, promotional and preparatory in nature.

### 5.2 Key Activities

- **KOL engagement** — structured outreach to clinicians and researchers at Charité, TU München and Universität Heidelberg (and adjacent centres) covering gynaecology, urology, paediatric gastroenterology and clinical microbiology.
- **Scientific events** — representation at key German and EU congresses (e.g. DGGG, MEDICA, ECCMID, EAU) for awareness and lead generation, with formal product promotion contingent on IVDR certification.
- **Market research** — mapping of laboratory chains, reimbursement frameworks (GKV / GOÄ), tendering practices and competitive positioning.
- **Distributor pre-screening** — identification and qualification of potential distribution partners for Phase 2.

- **IVDR coordination** — local interface with the Notified Body, regulatory consultants and clinical evaluation experts.

### 5.3 Operating Model

Phase 1 is a deliberately lean, low-overhead structure. No local employees will be hired. All activities will be carried out by Genomer's Türkiye-based management and scientific team through periodic visits to Germany combined with structured digital coordination. The Berlin office will provide a registered address and on-demand meeting infrastructure.

## 6. Phase 2 — Conversion into a GmbH

Following completion of IVDR certification (currently anticipated within approximately 12 months), the liaison office will be converted into a **GmbH**. The GmbH will assume full commercial capacity — product distribution, sales, customer invoicing, distributor management and, where appropriate, the role of *EU Authorised Representative* for Genomer's products under IVDR Article 11. Conversion will be staged so that commercial activity begins only after all regulatory prerequisites have been satisfied.

| Phase 2 Capability                    | Purpose                                                                                    |
|---------------------------------------|--------------------------------------------------------------------------------------------|
| Direct sales & distributor management | Invoicing of customers, management of laboratory chain accounts and regional distributors  |
| EU Authorised Representative role     | Single point of regulatory responsibility for Genomer's IVDR-certified portfolio in the EU |
| Post-market surveillance              | EUDAMED reporting, vigilance, customer feedback and clinical performance follow-up         |
| Local hiring                          | Country Manager and Scientific Affairs lead, scaling with revenue                          |

## 7. Financial Plan — Phase 1

The Berlin liaison office will not generate revenue. Operating costs will be funded entirely from Genomer's own resources and consolidated as a cost line of the parent company. The indicative annual budget for Phase 1 operations is summarised below; figures represent the upper bound of currently approved planning ranges and will be finalised by management based on actual activity volume.

| Cost Category                                  | Description                                                                                                     | Indicative Annual (€)   |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|-------------------------|
| Office & administration                        | Registered Berlin address, serviced / virtual office, meeting room access, accounting, local advisory           | 12,000 – 20,000         |
| Travel & field visits                          | Türkiye–Germany travel for management and scientific team; in-country mobility for KOL meetings and site visits | 25,000 – 40,000         |
| KOL engagement & hospitality                   | Scientific meetings, advisory boards, hospitality within compliant limits                                       | 15,000 – 25,000         |
| Congresses & promotional materials             | DGGG, MEDICA, ECCMID, EAU and similar; booth, brochures, monographs (DE / EN)                                   | 15,000 – 30,000         |
| Regulatory & consulting                        | IVDR clinical evaluation experts, regulatory advisory, translation services                                     | 10,000 – 20,000         |
| Contingency (10%)                              | Unforeseen costs and exchange-rate buffer                                                                       | 8,000 – 14,000          |
| <b>Total Phase 1 — Annual Operating Budget</b> |                                                                                                                 | <b>85,000 – 150,000</b> |

**Funding source.** The Phase 1 budget is fully covered from the parent company's operating cash flow. No bank financing, equity round or third-party funding is required for the Phase 1 establishment or operation of the Berlin liaison office.

## 8. Milestones & Timeline

|                       |                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------|
| Q2 2026               | Berlin liaison office registered. Service-office address activated.<br>Initial KOL outreach plan finalised. |
| Q3 2026               | First wave of KOL engagement (Charité, TU München, Heidelberg).<br>Market research baseline completed.      |
| Q4 2026               | Distributor pre-screening shortlist established. First German / EU<br>congress representation.              |
| Q1 – Q2 2027          | IVDR Notified Body audit cycle. Awareness-building campaigns<br>and scientific symposia.                    |
| Q2 – Q3 2027 (target) | IVDR certification granted. Liaison office converted into GmbH;<br>commercial operations begin.             |

## 9. Risk Considerations & Mitigation

| Risk                                | Mitigation                                                                                                                                                                                  |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IVDR certification delay            | Phase 1 activities (KOL engagement, market research) are non-commercial and do not depend on certification timing. Phase 2 conversion is sequenced to follow certification, not predate it. |
| Currency / cost variation           | Conservative budget ranges, 10% contingency line, and quarterly review against actuals.                                                                                                     |
| Regulatory misclassification        | Liaison office structured strictly as Verbindungsbüro under German law; legal counsel engaged to verify boundary conditions before Phase 2.                                                 |
| Reputation / unauthorised promotion | All product-level promotional content gated until IVDR certification is granted; pre-certification activities limited to scientific awareness and pipeline preparation.                     |

## 10. Conclusion

The establishment of a Berlin liaison office is a measured, low-risk and regulation-aligned step that prepares Genomer's entry into the European diagnostic market. Phase 1 builds the scientific credibility, customer pipeline and regulatory presence necessary for a successful Phase 2 commercial launch through a German GmbH. The entire programme is funded from the parent company's resources, requires no external financing, and is governed by strict scope boundaries to ensure full compliance with German and European Union legislation throughout.
